

KOGI PLATFORM

Community, Spaces & Social Management System

Design Document — v1.0

March 2026

This document defines the architecture, subsystems, data models, interaction primitives, and AI workflows for the Kogi Community, Spaces, and Social Management System — the social layer of the Kogi independent-worker operating platform, comprising Spaces (KSPC), Rooms (KRMS), Feeds, Posts, Organizations, and the social graph that connects all users, portfolios, and communities.

Module Code	KSPC · KRMS · KCOM · KORG
Module Name	Spaces · Rooms · Community Feed · Organizations
Primary Language	Go (services) · Rust (systems) · Scala (data engine) · Angular (web client)
Database	PostgreSQL (network) · SQLite (local) · Redis (cache/realtime) · Kafka (streams)
Protocol	REST/GraphQL (external) · gRPC (internal) · WebSocket (realtime)
Status	Design Phase — MVP Definition

1. SYSTEM OVERVIEW

1.1 Purpose & Vision

The Kogi Community, Spaces & Social Management System is the connective social tissue of the Kogi platform. Where other modules — Office, Bank, Exchange, Studio — manage a user's work and assets, the Community layer connects users to one another: through shared spaces and rooms, social feeds and posts, events, organizations, teams, collectives, and cooperatives.

The design philosophy is that the social layer must feel native to portfolio work — not a bolted-on social network, but a purposeful space where independent workers, collectives, cooperatives, and autonomous organizations discover one another, collaborate, exchange, and govern themselves. Every post, space, or room is tied to portfolio components, and every action generates data that the Kogi Engine uses to personalize, match, and recommend.

1.2 Position in the Kogi Platform

The Community system sits between the private work world (Office, Bank, Studio) and the public economic layer (Exchange, Marketplace). It is the platform's social graph and real-time collaboration backbone.

Upstream (feeds into Community)	kogi-office (portfolios, projects) · kogi-studio (creative assets) · kogi-bank (campaigns)
Downstream (Community feeds into)	kogi-exchange (matchmaking) · kogi-marketplace (discovery) · kogi-engine (analytics, recommendations)
Parallel modules	kogi-home (dashboard aggregator) · kogi-organizations (governance) · kogi-profile (identity)
AI Layer	Oba assistant · RecommendationEngine · PersonalizationEngine · MatchEngine

1.3 Core Subsystems

Code	Subsystem	Primary Responsibility
KSPC	Spaces	Digital community spaces, organizations, teams, events
KRMS	Rooms	Real-time chat, DMs, group rooms, project rooms
KFED	Feed Service	Activity feeds, posts, timelines, notifications
KORG	Organizations	Autonomous orgs, collectives, cooperatives, federations
KSGR	Social Graph	Follow, subscribe, watch, connect relationships
KMTC	Match & Discovery	Worker matching, space recommendations, talent discovery
KENG·COM	Community Engine	Analytics, personalization, sentiment, engagement scoring

2. KSPC — SPACES

2.1 Concept

A Space is a named digital community environment. Spaces are the top-level social containers on the Kogi platform, equivalent to a workspace, server, or hub in other social platforms — but purpose-built for portfolio work, cooperative economics, and independent-worker collaboration.

Spaces can represent teams, organizations, communities of practice, project communities, cooperative guilds, investment clubs, DAOs, or any self-defined group. Each Space has rooms, events, member management, a feed, and optionally an organizational structure.

2.2 Space Types

Type	Description	Example
Community	Open or invite-only community around a topic or interest	Real Estate Investors Community
Team	Collaborative working group, squads, tribes, guilds, chapters	Design Squad Alpha
Organization	Formal legal or operational entity (LLC, Corp, Trust, Fund)	Pamoja Capital LLC
Collective	Informal resource-sharing group, skill pool	Freelance Dev Collective
Cooperative	Member-owned economic cooperative	Worker-Owned Creative Coop
DAO / Autonomous Org	Decentralized autonomous organization with on-chain governance	Protocol Builders DAO
Federation	A network of linked Spaces, Collectives, or Orgs	Pamoja Federation
Project Space	A Space tied to a specific portfolio project or program	Brand Launch 2026 Space
Private Studio	Personal creative or research environment	Jordan's Innovation Lab

2.3 Space Data Model

Every Space is a PortfolioComponent at its core, inheriting the full component graph and metadata system:

Field	Description
space.id (UUID)	Platform-unique identifier
space.type	community team organization collective cooperative dao federation project studio
space.name	Display name of the Space

space.handle	Unique @handle for discovery and mention
space.visibility	public private protected invite-only
space.status	active paused archived pending
space.owners[]	UUIDs of owning users; hierarchical privilege tiers
space.members[]	Member roster with roles: owner admin mod member contributor viewer guest
space.rooms[]	Linked Room component IDs
space.events[]	Linked Event component IDs
space.feed	Space-scoped activity feed ID
space.organization	Optional linked Organization entity
space.portfolio_links[]	Linked PortfolioComponent IDs (projects, programs, assets)
space.tags[]	Topic/hashtag labels for discoverability
space.policies[]	Governance and access policy IDs
space.metadata	id · owners · created_at · updated_at · vector_clock · version · properties
space.analytics	Engagement metrics, member growth, reach, sentiment scores

2.4 Space Actions & Interactions

Users and systems can take the following actions on a Space:

Action	Actor	Notes
create	User / System	Initialize a new Space with type, name, visibility
join	User	Request or instant join depending on visibility policy
invite	Member	Send invite to specific user or group
follow	User	Subscribe to Space feed without joining
subscribe	User	Paid or privileged subscription tier
post	Member	Publish content to Space feed
event.create	Member (admin+)	Create and schedule an Event within the Space
room.create	Member (admin+)	Spin up a new Room inside the Space
poll / survey	Member	Create a poll visible to Space members
campaign	Member (admin+)	Launch fundraising or resource-gathering campaign
governance.vote	Member	Participate in Space governance decisions
tag / mention	Member	Tag portfolio components or @mention users
report	Member	Report content or member for moderation
archive	Owner	Move Space to deep archive state
federate	Owner	Link Space into a Federation graph

2.5 Space Discovery & Search

Spaces are discoverable through the Kogi SearchEngine and RecommendationEngine. Discovery surfaces include:

- Explore feed — globally recommended Spaces based on PersonalizationEngine scoring
- Search — full-text and tag-based search via the QueryEngine and SearchEngine
- Discover — AI-curated topic expansions: 'related to X, you might explore...'
- Match — the MatchEngine links user skill profiles to relevant Spaces and communities
- Trending — TelemetryEngine surfaces trending Spaces by engagement velocity

3. KRMS — ROOMS

3.1 Concept

Rooms are real-time communication channels. They exist within Spaces or as standalone communication threads attached to portfolio items, projects, deals, or other platform entities. Rooms are the primary synchronous and asynchronous collaboration mechanism on the Kogi platform.

3.2 Room Types

Room Type	Description	Linked Entity
Direct (DM)	Private 1:1 messaging between two users	User → User
Group	Multi-user private channel (up to configurable limit)	User group
Space Room	A channel inside a Space (general, topic, project)	Space
Project Room	Collaborative room tied to a specific portfolio project	Project (PortfolioItem)
Portfolio Room	Coordination room for a whole portfolio or program	Portfolio / Program
Deal Room	Negotiation space for marketplace deals or exchange proposals	Exchange listing
Community Room	Public or semi-public community discussion channel	Community / Space
Event Room	Temporary room for an event or meeting	Event
Governance Room	DAO/org voting and proposal discussion room	Organization
AI Room	Chat interface with the Oba AI assistant	System / User
Support Room	User support and help desk threads	Platform support

3.3 Room Data Model

room.id	Platform-unique UUID
room.type	dm group space project portfolio deal community event governance ai support
room.name	Display name
room.visibility	public private protected
room.members[]	Member roster with roles: owner moderator member readonly bot
room.messages[]	Ordered message log (paginated, event-sourced)

room.pinned_messages[]	Pinned high-priority messages
room.linked_entity	ID of linked PortfolioComponent, Event, Exchange listing, etc.
room.settings	Notification preferences, archival policy, retention rules
room.bots[]	AI agents or automation bots attached to the room
room.status	active archived paused read-only
room.metadata	Full component metadata: id, owners, created_at, vector_clock, version

3.4 Message Data Model

message.id	UUID
message.room_id	Parent room reference
message.author_id	Sending user or bot ID
message.type	text file media link system reaction poll call embed
message.content	Rendered content body (markdown-compatible)
message.attachments[]	Files, images, documents, portfolio component embeds
message.reactions[]	Emoji reactions with user ID lists
message.thread_id	Parent message ID for threaded replies
message.mentions[]	Mentioned user or component IDs
message.status	sent delivered read failed
message.edited_at	Timestamp of last edit
message.metadata	Created_at, vector_clock, policy_ids

3.5 Real-Time Architecture

Rooms use WebSocket connections for real-time delivery, backed by Redis pub/sub for message fanout and Kafka for durable event streaming and replay:

- Client connects to KRMS service via WebSocket on room join
- Messages published to Redis channel for instant delivery to online subscribers
- All messages also written to Kafka topic for durability, analytics, and replay
- Presence (online/typing indicators) managed via Redis TTL keys
- Offline users receive messages on reconnect via PostgreSQL message log
- AI agent (Oba) subscribes to designated AI Room channels and responds via the Sambara agent system

4. KFED — FEED & SOCIAL LAYER

4.1 Feed Architecture

The Feed Service (KFED) powers all activity streams across the Kogi platform. Unlike a single monolithic social feed, Kogi has a layered feed architecture where feeds are scoped to the entity level — personal, space, portfolio, event, and global feeds — all unified through the personalization and recommendation engines.

4.2 Feed Types

Feed Scope	Content Sources	Personalization
Personal Home Feed	Followed users, spaces, portfolios, tags, subscriptions	Full RecommendationEngine scoring
Space Feed	Posts within a specific Space from members	Space-scoped ranking, pinned posts
Portfolio Feed	Updates, milestones, changes for a portfolio or item	Chronological + relevance
Event Feed	Discussions, posts, updates tied to an Event	Chronological
Organization Feed	Governance updates, announcements, member activity	Role-filtered visibility
Marketplace Feed	New listings, deals, offers, campaigns	Match scored by MatchEngine
Explore / Discover Feed	Global trending content, recommended Spaces, creators	Full AI personalization
Notification Feed	System alerts, mentions, replies, action required	Priority-ranked by urgency

4.3 Post Data Model

post.id	UUID
post.author_id	User or organization ID
post.type	post update milestone announcement showcase article poll event campaign repost
post.content	Richtext body (markdown + embeds)
post.attachments[]	Media, files, portfolio component cards, links
post.visibility	public followers space private custom
post.tags[]	Hashtags and topic labels
post.mentions[]	Mentioned user, space, or component IDs

post.linked_component	Optional linked PortfolioComponent (project milestone, asset release, etc.)
post.analytics	Impressions, reach, engagements, CTR, view time, sentiment score
post.reactions	likes, applause, support, insightful — with user ID lists
post.comments[]	Nested comment thread (comment has same structure as post, scoped)
post.shares	Repost and share count
post.saves	Bookmark count and user ID list
post.status	draft scheduled published archived removed
post.metadata	id · created_at · updated_at · vector_clock · version · policy_ids

4.4 Social Interaction Primitives

The following primitives are available on Posts, Spaces, PortfolioComponents, and User Profiles:

Primitive	Target Entities	Engine Impact
like / react	Post, Comment, Component	Engagement signal → AnalyticsEngine
comment	Post, Component, Event	Depth engagement → RecommendationEngine
share / repost	Post, Showcase item	Virality signal → TelemetryEngine
save / bookmark	Post, Component, Space	Long-term interest signal → PersonalizationEngine
follow	User, Space, Tag, Portfolio	Feed subscription and social graph edge
subscribe	Space, Portfolio, Creator	Paid or privileged follow tier
watch	Component, Project, Portfolio	Change notification subscription
tag / mention	Post, Room message	Graph relationship + notification trigger
hashtag / topic	Post, Component	Topic graph membership, trending signal
poll / survey	Space, Post	Governance and engagement data collection
invite	Space, Room, Event	Membership and participation management
donate	Component, Campaign, Org	Capital flow → kogi-bank
invest	Component, Org, Campaign	Equity/stake flow → kogi-bank / kogi-exchange
contribute	Project, Program, Campaign	Resource contribution tracking
campaign	Space, Component, Org	Fundraising → kogi-bank
report	Post, User, Space	Moderation queue entry

5. KORG — ORGANIZATIONS, COLLECTIVES & COOPERATIVES

5.1 Concept

The Organizations system (KORG) is the governance and coordination layer for groups of users who wish to operate collectively. It encompasses the full spectrum from loose informal collectives to formally governed autonomous organizations and cooperative federations.

Organizations are first-class citizens on the Kogi platform — they have their own profiles, portfolios, wallets, spaces, and feeds. An organization's portfolio can contain projects, programs, assets, and financial instruments, all managed with multi-member governance rules.

5.2 Organization Types

Type	Description	Governance Model
Collective	Informal resource and skill sharing group; no formal legal entity required	Consensus / flat
Cooperative	Member-owned economic entity with shared profits and voting rights	One member, one vote
Autonomous Organization	Rule-governed org with codified bylaws and automated governance	Proposal + quorum vote
DAO	Decentralized autonomous org; optionally on-chain governance	Token-weighted or 1M1V
Team	Operational working group within an org or space	Hierarchical / lead-managed
Guild	Skill-based professional association	Merit / reputation weighted
Federation	Network of linked orgs, collectives, cooperatives	Federal / representative
Foundation	Non-profit oriented entity; grants, donations	Board / trustee governed
Investment Club	Group investing and portfolio management entity	Proportional stake voting

5.3 Organization Data Model

org.id	UUID — platform-unique identifier
org.type	collective cooperative dao autonomous team guild federation foundation club
org.name	Display name
org.handle	@handle for discovery and mention

org.legal_entity	Optional linked legal entity (LLC, Corp, Trust, Fund, etc.)
org.members[]	Member roster: role, stake, joined_at, status, permissions
org.roles[]	Custom roles with privilege tiers: founder admin governor treasurer member contributor observer
org.portfolio_id	Linked organizational portfolio
org.wallet_id	Linked organizational wallet
org.space_id	Primary Space for the organization
org.governance	Governance model config: voting_type, quorum_threshold, proposal_rules
org.proposals[]	Active and historical governance proposals
org.policies[]	Access, financial, and governance policy IDs
org.metadata	Full PortfolioComponent metadata: id, owners, created_at, vector_clock, version

5.4 Governance System

The governance system allows organizations to run structured decision-making processes:

Component	Description
Proposal	A motion to take action; has title, body, linked action, voting window, and required quorum
Vote	Member vote on a proposal: approve reject abstain; weighted by stake or 1-member-1-vote
Quorum	Minimum participation threshold for a vote to be valid; configurable per org type
Resolution	Outcome of a passed proposal; may trigger automated actions via Oba agent
Veto	Founder or governance-tier override mechanism for emergency governance
Amendment	Proposal to modify org bylaws, policies, or governance rules
Treasury Proposal	Financial action requiring approval: budget allocation, investment, distribution
Membership Proposal	Adding, removing, or changing the role of a member

5.5 AI Governance Assistant

The Oba AI assistant handles the full governance lifecycle for cooperative and DAO members:

- Drafts proposals from natural-language intent (e.g. 'propose we allocate \$5K to marketing')
- Monitors quorum status and sends member notifications at configured intervals
- Summarizes arguments and comments from the governance room for absent members
- Executes passed resolutions automatically where linked actions are configured

- Flags unresolved or expiring proposals in the member dashboard briefing
- Provides governance health analytics: participation rates, vote turnout, resolution velocity

6. SOCIAL GRAPH & RELATIONSHIP MODEL

6.1 Graph Design

The Kogi social graph is a directed, typed property graph. Nodes represent users, spaces, organizations, portfolio components, events, and posts. Edges represent typed relationships with properties such as weight, timestamp, visibility, and metadata.

The GraphEngine (Scala) provides graph traversal, critical path analysis, dependency closure, and social graph analytics.

6.2 Node Types

Node Type	Description
User	Individual platform user; has profile, personas, skills, contact
Space	Community space or organization environment
Organization	Formal or informal collective entity
PortfolioComponent	Portfolio, program, project, resource, asset, artifact
Post	Content item published to a feed
Event	Scheduled gathering, meeting, or conference
Tag / Topic	Hashtag or topic label node connecting related content
Campaign	Fundraising or resource-gathering initiative

6.3 Edge Types (Relationship Primitives)

Edge	From → To	Properties
follows	User → User Space Tag Portfolio	since, notification_level
subscribes	User → Space Portfolio Creator	tier, since, auto_renew
watches	User → PortfolioComponent	since, alert_level
member_of	User → Space Organization	role, joined_at, stake, status
owns	User → PortfolioComponent Space Org	privilege_tier, since
collaborates_on	User → PortfolioComponent	role, contribution_type
invested_in	User Org → PortfolioComponent Campaign	amount, instrument, date

linked_to	PortfolioComponent → PortfolioComponent	link_type, weight
posted_in	Post → Space Feed	visibility, pinned
tagged_with	Post Component → Tag	weight, source
part_of	Space → Federation Org → Federation	federate_since, role

7. ANALYTICS & ENGAGEMENT ENGINE

7.1 Community Analytics Overview

All social interactions on the Kogi platform generate telemetry events that flow through the KogiEngine's AnalyticsEngine, TelemetryEngine, and RecommendationEngine. The Community module contributes the richest behavioral and engagement signal set on the platform.

7.2 Engagement Metrics

Metric Category	Metrics	Engine
Engagement	Likes, reactions, comments, shares, saves, poll responses, engagement rate (engagements / reach)	AnalyticsEngine
Content Performance	Impressions, reach, CTR, video completion rate, hashtag performance, best post time	AnalyticsEngine
Audience	Demographics, interests, follower growth rate, member growth rate, churn rate	PersonalizationEngine
Sentiment	Positive / neutral / negative categorization of mentions, posts, and comments	AnalyticsEngine
Space Health	Member activity rate, post frequency, room message volume, governance participation	RiskEngine
Influence	Share of voice, brand mentions, collaboration network centrality score	GraphEngine
Discovery	Search impressions, explore appearances, recommendation clicks, match acceptance rate	RecommendationEngine · MatchEngine
Paid / Campaign	Campaign reach, contribution rate, cost per contribution, ROAS for promoted posts	AnalyticsEngine
Behavioral	Time spent per space/room, scroll depth, session paths from post to portfolio item	TelemetryEngine

7.3 Personalization & Recommendation

The PersonalizationEngine builds dynamic user profiles from community behavior to drive feed ranking and Space recommendations:

- Collaborative filtering — surfaces content liked by users with similar engagement patterns
- Content-based filtering — surfaces posts and spaces similar to those a user previously engaged with
- Hybrid scoring — combines both methods with recency, diversity, and cold-start handling
- Persona signals — user personas (professional, investor, creator, etc.) modulate scoring weights
- Contextual adaptation — time of day, device, current module, active project context all adjust feed ranking

- Feedback loop — click-through, dwell time, reaction, and ignore signals continuously retrain the model

7.4 Match Engine — Community Application

The MatchEngine applies to community interactions in the following ways:

- Worker-to-space matching: recommends Spaces based on skill profile, project history, and interest graph
- Collaborator matching: 'users who engaged with similar work to yours, who might want to collaborate'
- Investor-to-campaign matching: connects fundraising campaigns to users with matching investment interests
- Contributor-to-project matching: surfaces open project roles to community members with relevant skills
- Org-to-member matching: helps organizations find qualified members or specialists

8. AI WORKFLOWS — COMMUNITY LAYER

8.1 Oba AI Assistant in Community

The Oba AI assistant (powered by the Sambara agent system) provides intelligent community management, content creation, and collaboration facilitation across all community surfaces.

8.2 Content Amplification Workflow

When a user completes a portfolio milestone, Oba automatically drafts a community showcase post, suggests relevant spaces, identifies collaboration opportunities, and recommends optimal posting time — all awaiting one-click user approval.

Capability	Description
Post drafting	Generates compelling post from portfolio milestone or update with tone, tags, and CTA
Showcase optimization	Reviews portfolio item descriptions and tags for discoverability improvements
Collaboration matching	Identifies community members whose skills complement the user's active projects
Engagement analytics	Reports which content types and times drive highest engagement for this user
Space recommendations	Suggests spaces the user should join based on active project types
DM triage	Categorizes incoming DMs as collaboration, client inquiry, or general; drafts reply suggestions
Hashtag intelligence	Analyzes trending tags and recommends which to include for maximum reach
Cross-platform scheduling	Plans post timing and coordinates with linked social media provider integrations

8.3 Governance AI Workflow

Capability	Description
Proposal drafting	Converts natural language intent into structured governance proposals with linked actions
Quorum monitoring	Tracks vote participation and sends reminders at configurable thresholds
Argument summary	Summarizes room discussion and comments for members who missed debate
Resolution execution	Auto-executes passed proposals: budget allocations, role changes, policy updates

Proposal expiry alerts	Flags expiring or unresolved proposals in morning briefing
Governance health report	Weekly participation rates, vote turnout, resolution velocity, trend analysis

8.4 Community Growth Workflow

Trigger	AI Action
New portfolio item published	Suggest relevant spaces to share in; draft announcement post
Project milestone reached	Generate milestone card; identify collaborators for celebration or expansion
Campaign launched	Draft campaign announcement; identify matching investor profiles to notify
New space member joins	Welcome message; suggest rooms to join; surface relevant portfolio showcases
Engagement spike detected	Alert user; surface collaboration requests; suggest follow-up content
Collaboration request received	Triage, summarize, draft suggested response for user approval
Governance quorum missed	Re-notify members; extend window; suggest simplified proposal if appropriate

9. SERVICE ARCHITECTURE

9.1 Backend Services

Service	Language	Responsibilities
community-service (Go)	Go	Space CRUD, member management, governance actions, event management
post-service (Go)	Go	Post create/read/update/delete, reaction handling, comment management
feed-service (Go)	Go	Feed assembly, fanout-on-write, feed ranking, notification push
social-graph-service (Go)	Go	Follow/subscribe/watch relationship management, graph queries
chat-service (Go)	Go	Room management, message delivery, presence, room membership
message-service (Go)	Go	Message CRUD, threading, attachment management, search
event-service (Go)	Go	Event planning, RSVP, event feed, event rooms
notification-service (Go)	Go	Alert fanout, notification preferences, DLQ management
community-matching-engine (Scala)	Scala	Collaborator matching, space recommendations, talent discovery
community-analytics (Scala)	Scala	Engagement analytics, sentiment analysis, community health scoring

9.2 Data Storage

Store	Usage
PostgreSQL	Durable storage: spaces, orgs, members, posts, messages, events, social graph edges
Redis	Real-time: presence, pub/sub fanout, session cache, feed hot data, room membership
Kafka	Event streaming: all social events, feed events, analytics pipeline input
SQLite	Local/desktop client cache: offline message queue, local feed snapshot
S3 / MinIO	Media storage: post attachments, profile images, event media

9.3 API Endpoints

All community APIs follow the standard Kogi REST pattern at <https://api.kogi.io/v1/{service}/{resource}>:

Endpoint Group	Key Endpoints
Spaces	GET /kspc/spaces · POST /kspc/spaces · GET /kspc/spaces/{id} · POST /kspc/spaces/{id}/join · POST /kspc/spaces/{id}/rooms · GET /kspc/spaces/{id}/feed
Rooms	GET /krms/rooms · POST /krms/rooms · GET /krms/rooms/{id}/messages · POST /krms/rooms/{id}/messages · WS /krms/rooms/{id}/stream
Feed	GET /kfed/feed · GET /kfed/feed/explore · GET /kfed/feed/notifications · POST /kfed/posts · GET /kfed/posts/{id}
Social Graph	POST /ksgr/follow · DELETE /ksgr/follow · POST /ksgr/subscribe · GET /ksgr/followers/{user_id} · GET /ksgr/following/{user_id}
Organizations	GET /korg/orgs · POST /korg/orgs · GET /korg/orgs/{id} · POST /korg/orgs/{id}/proposals · POST /korg/orgs/{id}/vote
Events	GET /kspc/events · POST /kspc/events · GET /kspc/events/{id} · POST /kspc/events/{id}/rsvp
Search	GET /ksrc/spaces · GET /ksrc/posts · GET /ksrc/users · GET /ksrc/orgs · GET /ksrc/explore

10. THIRD-PARTY INTEGRATIONS

10.1 Social Platform Integrations

The Kogi ProviderSystem manages all third-party platform connections. Users can link external social media accounts and platform credentials to their Kogi profile, enabling cross-platform publishing, reach amplification, and communication bridging.

Provider	Integration Type	Capabilities
Facebook / Instagram	OAuth2 + API	Cross-post content, import followers, sync events
YouTube	OAuth2 + API	Embed video, sync channel activity, cross-publish
WhatsApp	Business API	Broadcast messages, customer communication bridge
Slack	OAuth2 + Webhooks	Cross-team notifications, channel mirroring, DM bridge
Zoom	OAuth2 + API	Event room video calls, meeting scheduling integration
Twitter / X	OAuth2 + API	Cross-post announcements, track mentions, import audience
LinkedIn	OAuth2 + API	Professional profile sync, job post distribution, network import
Discord	Bot API	Community server bridging, role sync, notification relay
OnlyFans / Patreon	OAuth2 + Webhooks	Subscription tier sync, subscriber import, payout integration

10.2 Communication & Collaboration Integrations

Provider	Integration Type	Capabilities
Gmail	OAuth2 + IMAP	Email-to-room bridge, DM-to-email relay, campaign outreach
Google Meet	OAuth2 + API	Event rooms linked to Meet calls, calendar integration
Microsoft Teams	OAuth2 + Webhooks	Team channel bridging, notification relay
Twilio	API	SMS notification relay, 2FA, event reminders

10.3 Provider System Architecture

All integrations are managed through the kogi-providers module:

- Provider Registry — central registry of all available third-party providers
- ProviderSystem — manages credentials, OAuth tokens, webhook endpoints, and API rate limits
- Affiliate System — manages affiliate links, discount codes, commission tracking, and payouts
- Tool Integration — providers can be linked as tools in a user's toolbox for workflow automation

- Version Control — provider API version tracking and graceful degradation on version changes

11. SECURITY, PRIVACY & ACCESS CONTROL

11.1 Access Control Model

The community layer inherits the Kogi platform RBAC model and extends it with community-specific roles:

Role	Scope	Privileges
Platform Admin	Global	Full moderation, content removal, ban, platform config
Space Owner	Space	Manage space config, members, rooms, events, policies
Space Admin	Space	Manage members and rooms, moderate content
Space Moderator	Space	Moderate content, manage reports, mute members
Space Member	Space	Post, comment, react, join rooms, create events
Space Contributor	Space	Post and comment; limited role in governance
Space Viewer	Space	Read-only; no posting rights
Org Governor	Organization	Propose and vote on governance; manage treasury
Org Treasurer	Organization	Manage organizational wallet and financial proposals
Org Member	Organization	Vote, comment, contribute; standard membership rights

11.2 Content Visibility Model

Visibility Level	Description	Who Can See
public	Visible to all users and unauthenticated visitors	Anyone
followers	Visible to followers and subscribers	Followers, subscribers
protected	Visible to approved followers	Approved followers
space	Visible to Space members only	Space members
organization	Visible to org members only	Org members with appropriate role
private	Visible only to explicitly mentioned parties	Tagged users, owner
custom	Rule-based visibility defined by owner	Per-policy access list

11.3 Data Privacy & Compliance

- GDPR right-to-erasure: complete post, message, and social graph data deletion on request

- Data minimization: only social interaction data required for function is collected
- Consent management: granular consent controls per data type and integration
- Network namespace isolation: community services operate in isolated network segments
- Encryption at rest and in transit: TLS 1.3 for all connections; AES-256 for stored message content
- Audit logging: all moderation, governance, and administrative actions logged to immutable audit trail

12. MVP FEATURE SCOPE

12.1 MVP Inclusion

Feature	Module	MVP Priority
Space creation and management	KSPC	P0 — Core
Space member management (join, invite, roles)	KSPC	P0 — Core
Direct messaging (1:1 rooms)	KRMS	P0 — Core
Group rooms	KRMS	P0 — Core
Post creation and feed	KFED	P0 — Core
Follow / unfollow users and spaces	KSGR	P0 — Core
Like, comment, share on posts	KFED	P0 — Core
Notifications (mentions, replies, alerts)	KFED	P0 — Core
Basic organization creation (collective, team)	KORG	P1 — High
Activity feed per space	KFED	P1 — High
Event creation and RSVP	KSPC	P1 — High
Portfolio showcase posts	KFED	P1 — High
Space discovery / explore	KMTC	P1 — High
Governance proposals and voting	KORG	P2 — Medium
DAO / cooperative governance model	KORG	P2 — Medium
AI post drafting (Oba)	AI Layer	P2 — Medium
Collaboration matching	KMTC	P2 — Medium
Third-party social platform integration	Provider	P3 — Later
Advanced analytics dashboard	KENG	P3 — Later
Federation of spaces and orgs	KSPC/KORG	P3 — Later

13. INTEGRATION WITH KOGI PLATFORM MODULES

13.1 Module Integration Map

Module	Integration with Community	Data Flow Direction
kogi-office	Portfolio items shared as showcase posts; project updates published to space feed; project rooms linked to portfolio items	Office → Community (publish)
kogi-bank	Fundraising campaigns appear in community feeds; donation and investment actions from community posts; org treasury linked to org wallet	Bi-directional
kogi-exchange	Deal rooms for marketplace negotiations; exchange listings shared in community spaces; matchmaking uses community social graph	Exchange → Community (publish) · Community → Exchange (match)
kogi-marketplace	Marketplace listings shared to relevant spaces; talent discovery uses space membership data; reviews and ratings posted to community	Bi-directional
kogi-studio	Design assets published to community showcase; creative ideas shared to relevant spaces; collaboration requests routed from studio	Studio → Community (publish)
kogi-profile	User profiles source community display info, skill data for matching; personas determine feed personalization and posting context	Profile → Community (read)
kogi-engine	All community events streamed to engine; feed ranking, match scoring, recommendation, analytics all powered by engine	Community → Engine (stream) · Engine → Community (score)
kogi-home	Dashboard aggregates community notifications, mentions, space activity, DM summaries	Community → Home (push)

14. EVENTS SYSTEM

14.1 Event Types

Events are a first-class entity in the Kogi Community system — they can be created within a Space, by an Organization, or as standalone portfolio-linked milestones:

Event Type	Description
Meeting	Scheduled video or audio call; integrates with Zoom, Google Meet
Conference	Multi-session structured gathering; has a schedule, multiple event rooms
Workshop	Interactive skill-building session with materials and exercises
Mastermind	Peer-to-peer knowledge sharing group session
AMA (Ask Me Anything)	Open Q&A session hosted by a user or organization
Launch	Product, project, or portfolio launch event
Gathering	Informal community social event
Tagup	Quick synchronous check-in; typically short duration
Demo Day	Showcase of projects, products, or portfolio items
Governance Vote	Formal voting event for an organization; tied to a Proposal

14.2 Event Data Model

event.id	UUID
event.type	meeting conference workshop mastermind ama launch gathering tagup demo vote
event.host_id	User or Organization ID
event.space_id	Parent Space (if applicable)
event.title	Event display name
event.description	Rich text description
event.schedule	start_time, end_time, timezone, recurrence_rule
event.capacity	Max participant count; null = unlimited
event.participants[]	RSVP roster: user_id, status (going maybe not_going), role
event.rooms[]	Linked rooms: main, breakout, hallway, governance
event.visibility	public space invite private
